

Rollei-Film offers the first modular color chemistry system worldwide: Digibase® C-41

In recent years, self processing of color negative films in home photo laboratories is rebounding popularity. The demand of products to process films and photo papers is increasing steadily.

A) On the one hand by returnees from the digital to the film based photography.

B) On the other hand more and more young digital photographers find the way to the film based photography.

Why? In a working and social environment, which is dominated by computer technology, the manual development of films and photo papers is a haptic moment. To get a manual developed negative or positive is an attractive alternative for high motivated photographers.

To make the start with manual development easier, Rollei-Film has developed special chemistry sets in close cooperation with international photographers. So that photographers with small and large film use, can also take advantage of the new sets.

RDC15

The DIGIBASE C-41 color photo chemistry set is characterized by the following qualities:

Color chemistry of highest quality, based on C-41 standard process.
User-friendly package sizes.

There are kits available for the development of 10, 20, 50 or 100 films.

Unique: the purchase of single components is possible.

Due to the optimized package sizes full depletion and the maximum utilization of the chemistry within the shelf-life is possible.

6-8 weeks shelf-life of the **working solutions** are in a high-necked bottle, according to the utilization factor.

Several years shelf-life of the non opened liquid concentrates.

Several month shelf-life of the following bathes after preparation.

Based on the excellent economy, the prices are lower than a development in a lab.

This picture of a customer shows, that the quality is excellent:
